## Introdução

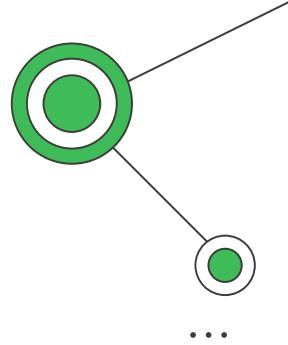

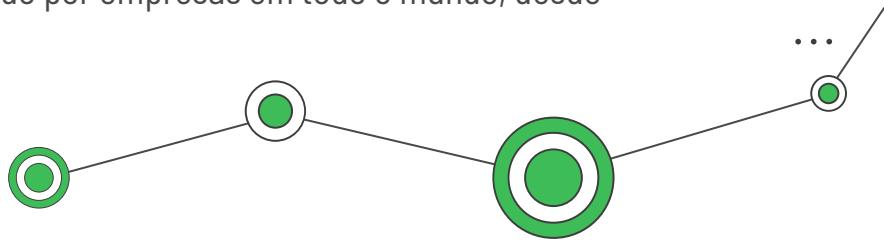

# O que é Spring

- O Spring é um ecossistema de desenvolvimento de aplicações Java voltado para o desenvolvimento de aplicações robustas e escaláveis. Ele fornece um conjunto abrangente de recursos e abstrações para lidar com as complexidades do desenvolvimento de software
- No início, o Spring Framework possuía diversos recursos integrados em uma mesma plataforma, porém o projeto cresceu tanto que alguns de seus recursos foram copiados por outros projetos. A partir daí, surgiu a ideia de modularizar as principais funcionalidades do Spring Framework e assim facilitar a integração com outros projetos que utilizavam outros frameworks. Com essa modularização surgiu o projeto Spring.
- Particularmente adequado para o desenvolvimento de aplicativos web, serviços RESTful e microsserviços, mas também pode ser usado em uma variedade de outras aplicações empresariais.

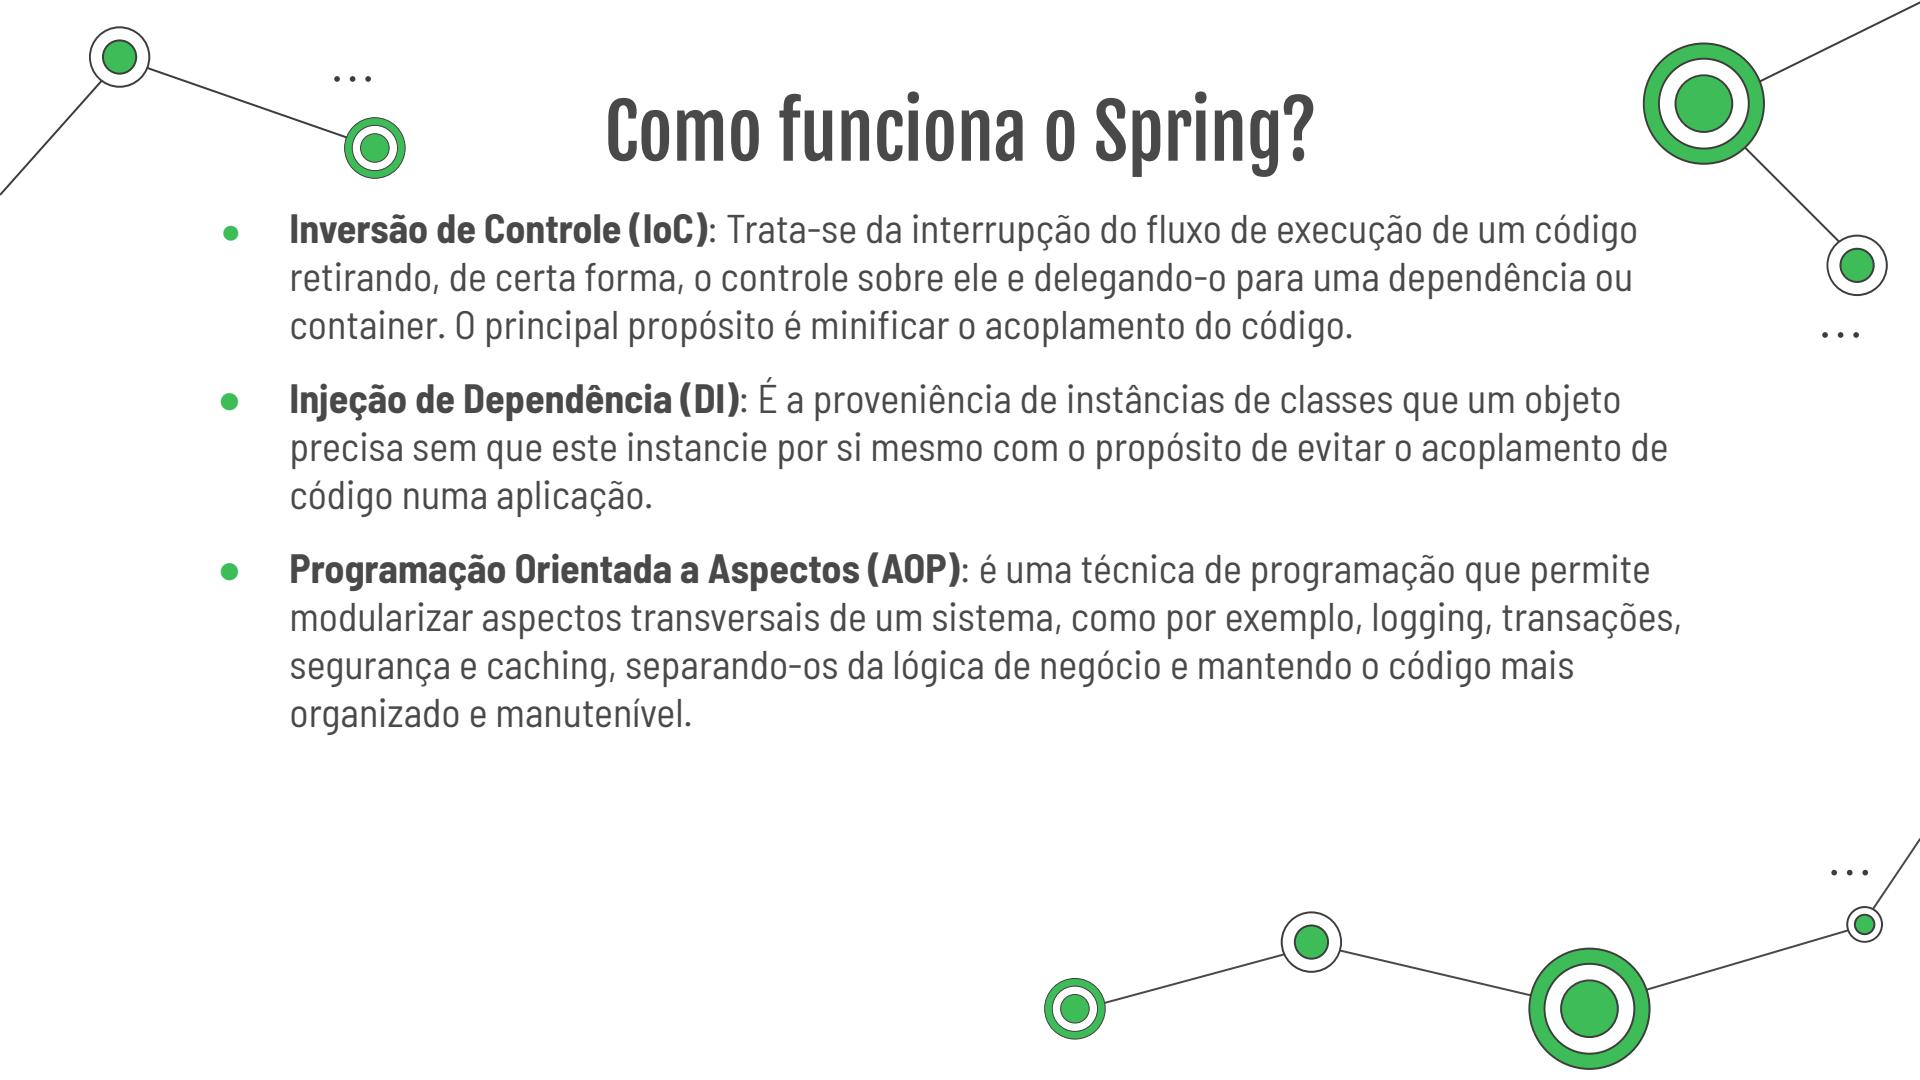

# Por que usar o Spring?

- Abordagem abrangente: O ecossistema Spring oferece uma ampla gama de bibliotecas e frameworks para atender a diferentes necessidades no desenvolvimento de aplicações. O ecossistema Spring abrange várias áreas, como desenvolvimento de aplicações web, acesso a bancos de dados, segurança, integração com serviços da web, gerenciamento de configurações, entre outros.
  - Integração perfeita: O Spring se integra facilmente com outras tecnologias e frameworks populares, permitindo que você aproveite os melhores recursos de cada um.
  - Modularidade e flexibilidade: O ecossistema Spring é modular, permitindo que você escolha e utilize apenas os módulos necessários para o seu projeto.
  - Comunidade ativa: O Spring possui uma comunidade de desenvolvedores muito ativa e engajada em todo o mundo. Além disso, é amplamente adotado por empresas em todo o mundo, desde startups até grandes organizações.
- 

# 02

# Fundamentos

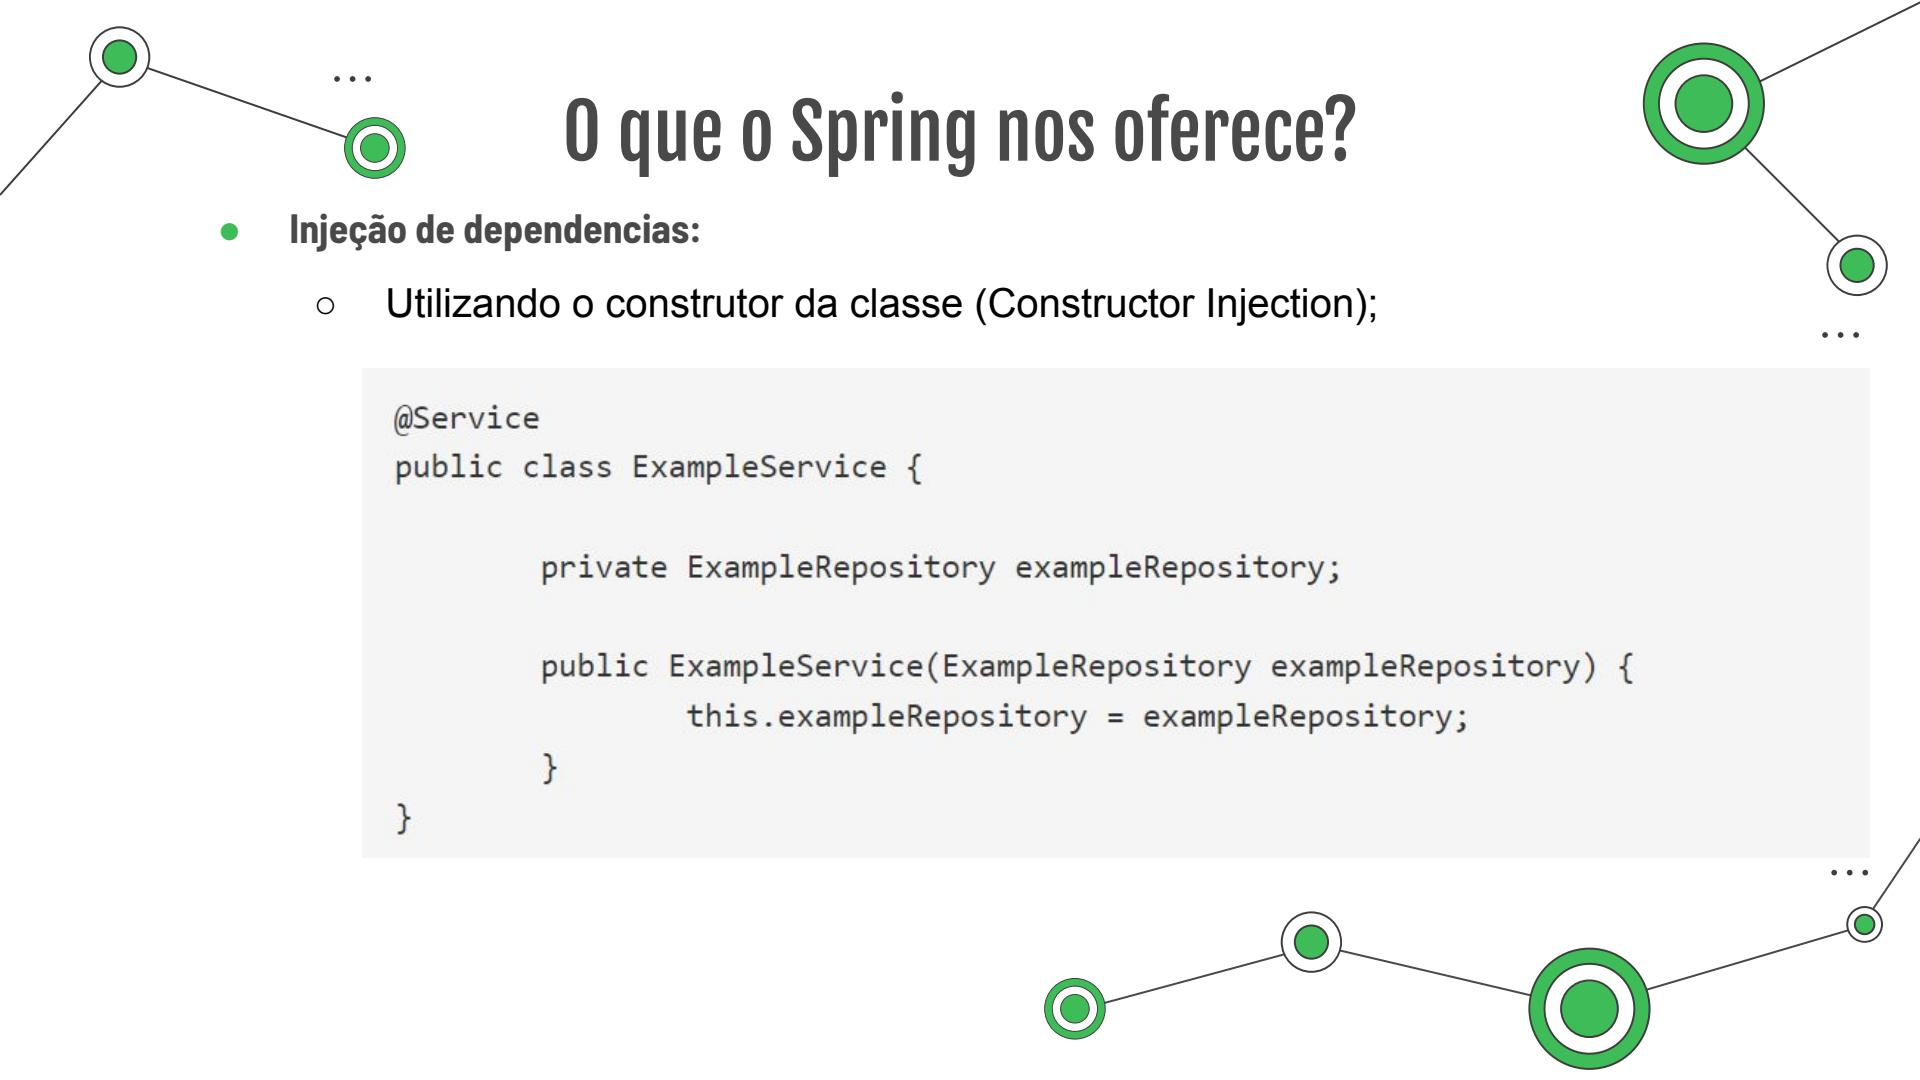

# Como funciona o Spring?

- **Inversão de Controle (IoC)**: Trata-se da interrupção do fluxo de execução de um código retirando, de certa forma, o controle sobre ele e delegando-o para uma dependência ou container. O principal propósito é minificar o acoplamento do código.
- **Injeção de Dependência (DI)**: É a proveniência de instâncias de classes que um objeto precisa sem que este instancie por si mesmo com o propósito de evitar o acoplamento de código numa aplicação.
- **Programação Orientada a Aspectos (AOP)**: é uma técnica de programação que permite modularizar aspectos transversais de um sistema, como por exemplo, logging, transações, segurança e caching, separando-os da lógica de negócio e mantendo o código mais organizado e manutenível.

# 03

## Principais Recursos

# O que o Spring nos oferece?

- Injeção de dependencias:
  - Utilizando o construtor da classe (Constructor Injection);

```
@Service  
public class ExampleService {  
  
    private ExampleRepository exampleRepository;  
  
    public ExampleService(ExampleRepository exampleRepository) {  
        this.exampleRepository = exampleRepository;  
    }  
}
```

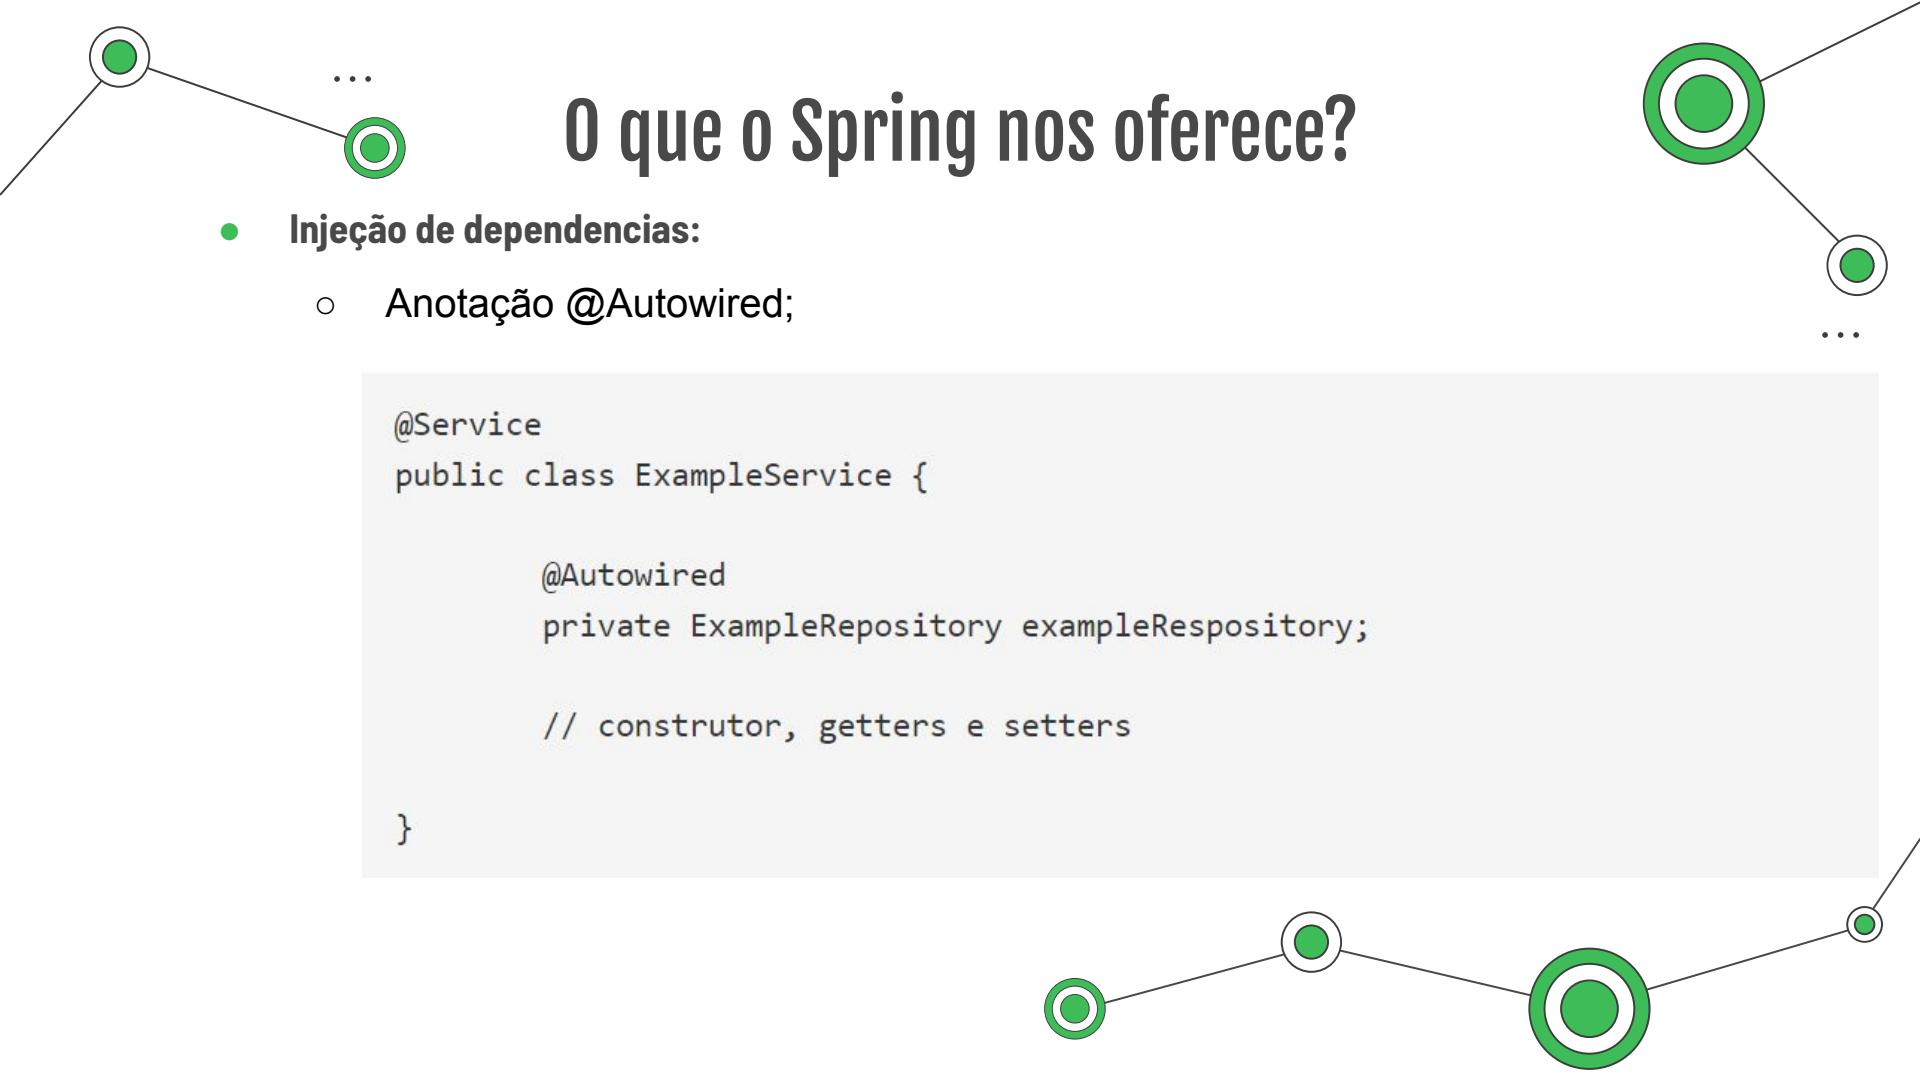

# O que o Spring nos oferece?

- Injeção de dependencias:
  - Utilizando o método setter (Setter Injection).;

```
@Service  
public class ExampleService {  
  
    private ExampleRepository exampleRepository;  
  
    @Autowired  
    public void setExampleRepository(ExampleRepository  
exampleRepository) {  
  
        this.exampleRepository = exampleRepository  
    }  
}
```

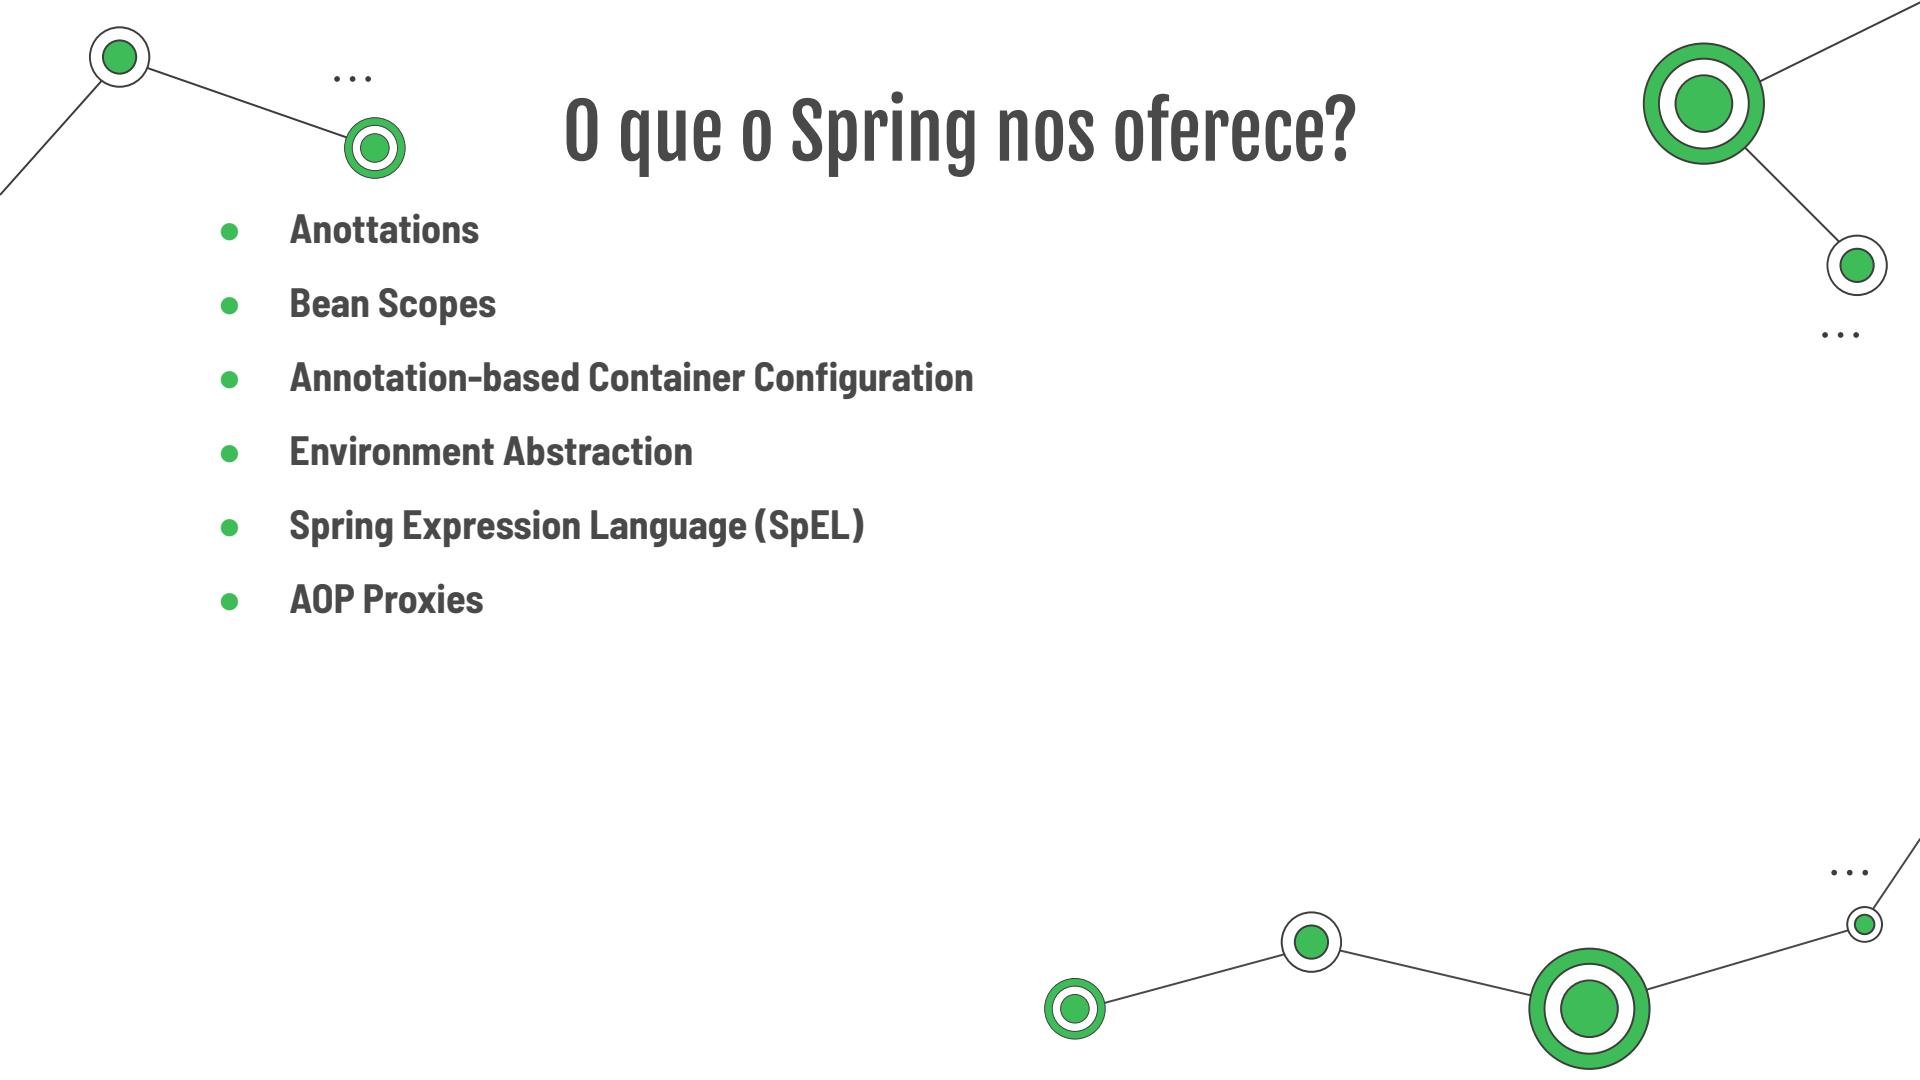

# O que o Spring nos oferece?

- Injeção de dependencias:
  - Anotação @Autowired;

```
@Service  
public class ExampleService {  
  
    @Autowired  
    private ExampleRepository exampleRespository;  
  
    // construtor, getters e setters  
  
}
```

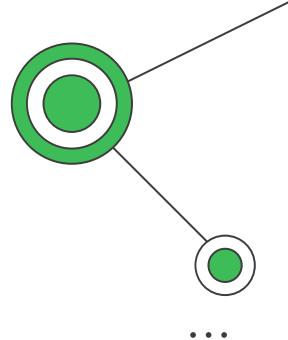

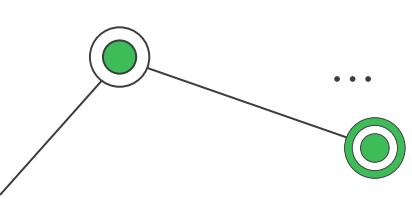

# O que o Spring nos oferece?

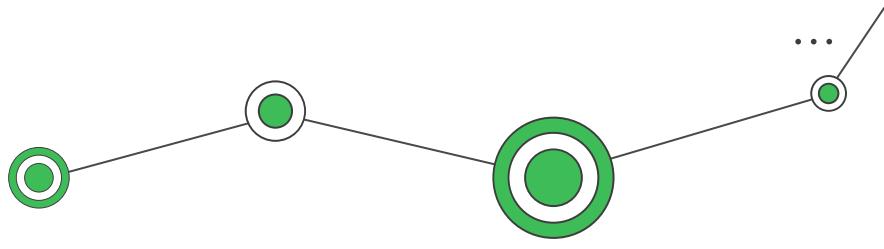

- **Annotations**
- **Bean Scopes**
- **Annotation-based Container Configuration**
- **Environment Abstraction**
- **Spring Expression Language (SpEL)**
- **AOP Proxies**

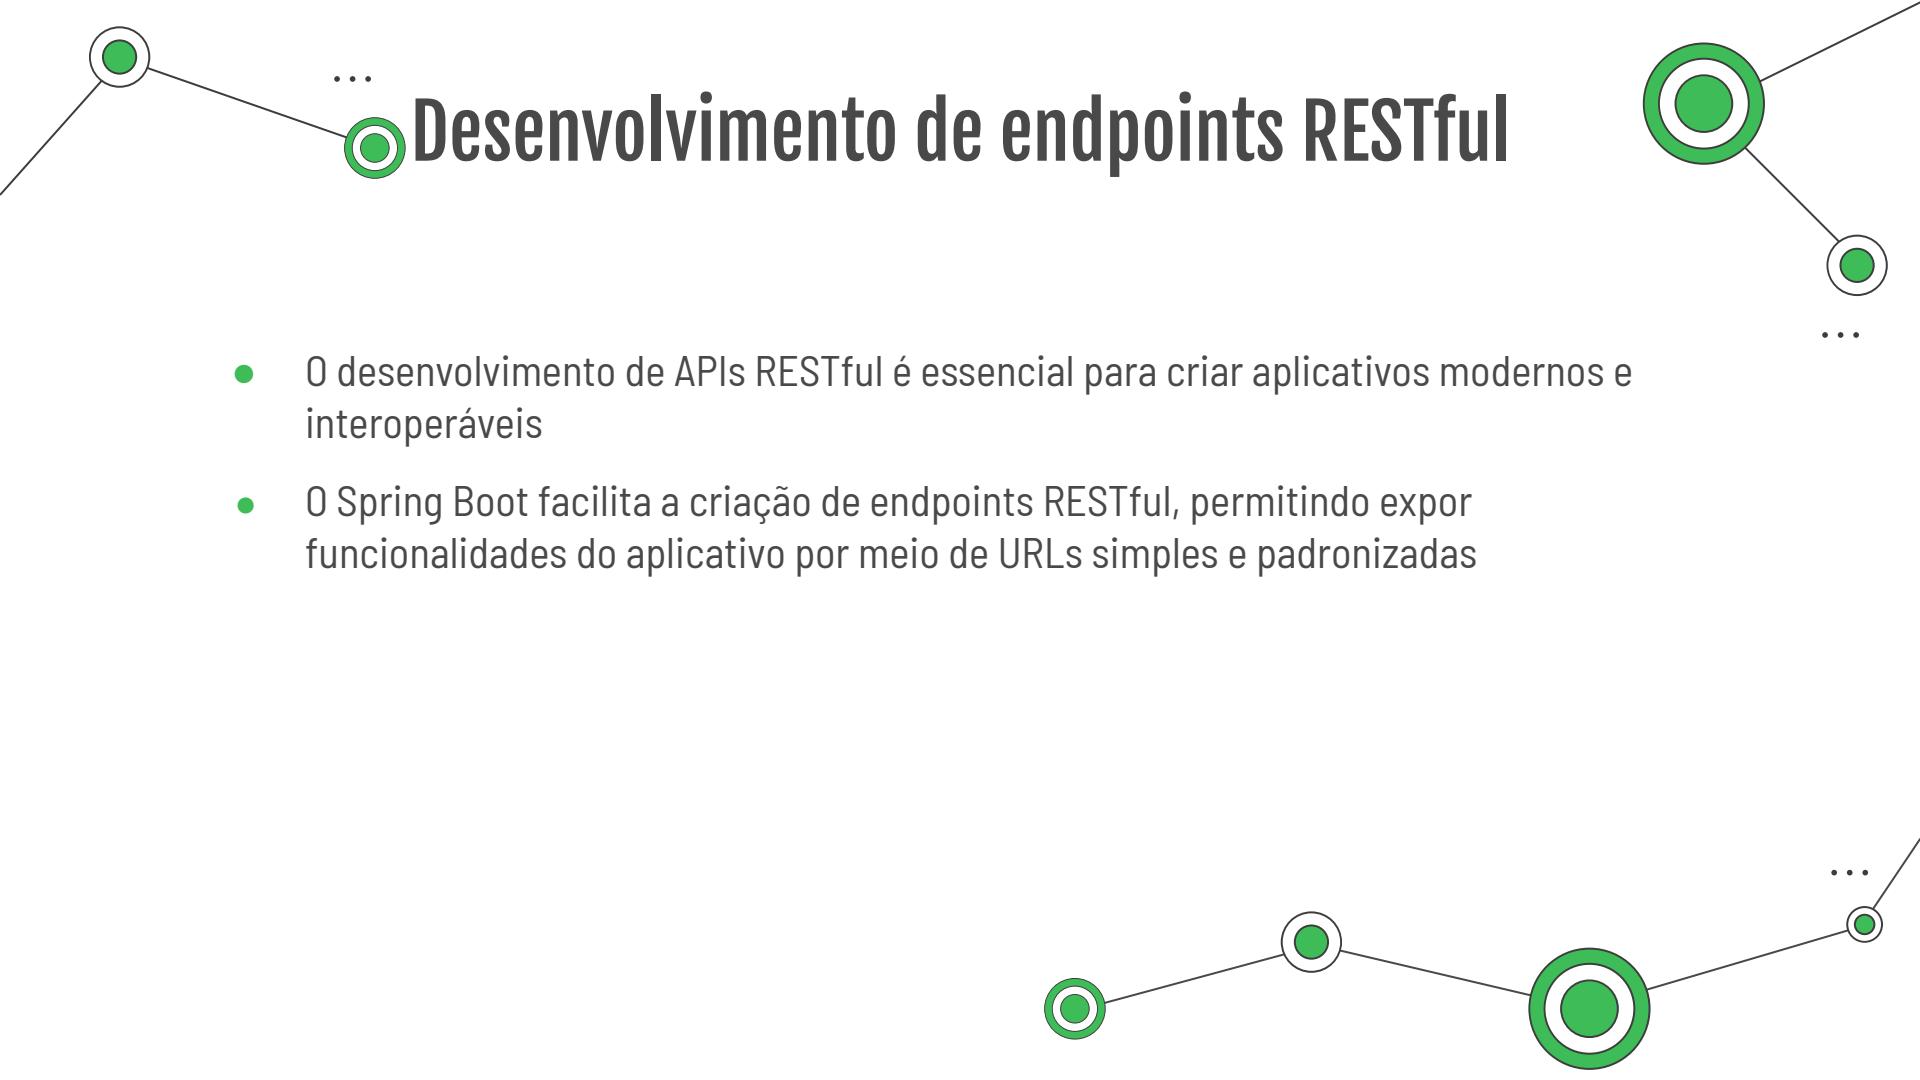

# 04

## Desenvolvendo Aplicações

# Como começar?

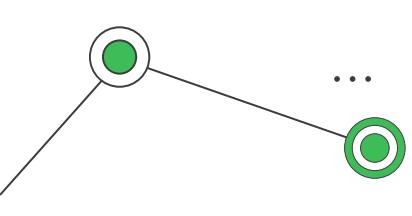

- <https://start.spring.io/>
- 

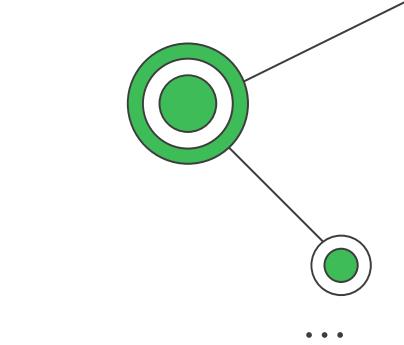

# Desenvolvimento de endpoints RESTful

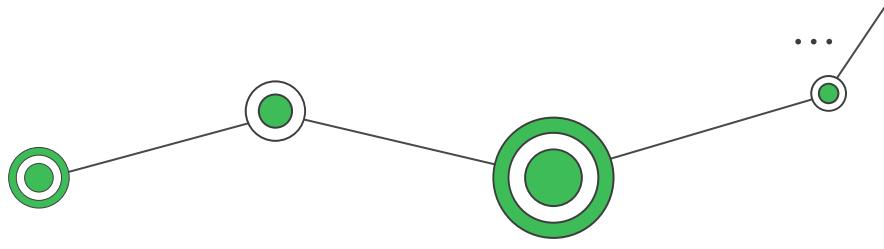

- O desenvolvimento de APIs RESTful é essencial para criar aplicativos modernos e interoperáveis
- O Spring Boot facilita a criação de endpoints RESTful, permitindo expor funcionalidades do aplicativo por meio de URLs simples e padronizadas

```
...  
@RestController  
@RequestMapping("/api")  
public class ExemploController {  
  
    @GetMapping("/recurso")  
    public ResponseEntity<String> obterRecurso() {  
        String recurso = "Este é um exemplo de resposta RESTful.";  
        return ResponseEntity.ok(recurso);  
    }  
}
```

# Testes Automatizados

- Os testes automatizados são fundamentais para garantir a qualidade do software.
  - O Spring Boot oferece suporte para escrever testes automatizados, incluindo testes de unidade e testes de integração.
- 

```
@RunWith(SpringRunner.class)
@SpringBootTest
public class ExemploControllerTest {

    @Autowired
    private MockMvc mockMvc;

    @Test
    public void testObterRecurso() throws Exception {
        mockMvc.perform(get("/api/recurso"))
            .andExpect(status().isOk())
            .andExpect(content()
                .string("Este é um exemplo de resposta RESTful."));
    }
}
```

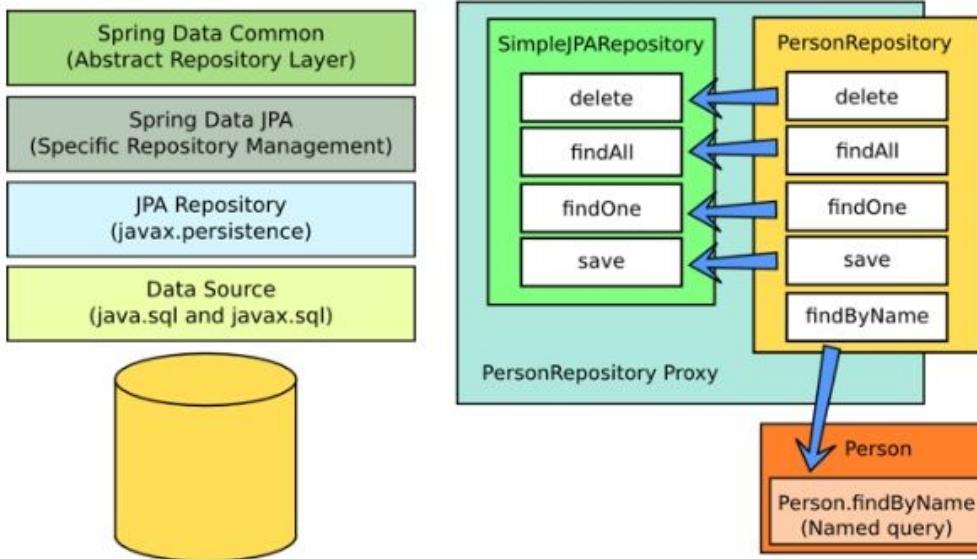

# 05

## Ecossistemas e Interações

# Spring Framework Ecosystem

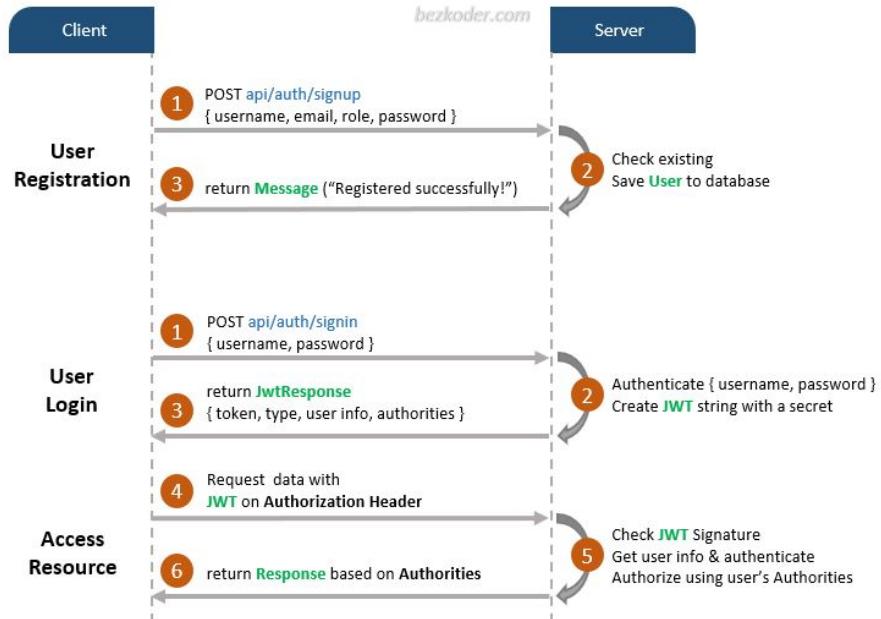

# Spring Data

```
...  
@Entity  
public class Produto {  
  
    @Id  
    @GeneratedValue(strategy = GenerationType.IDENTITY)  
    private Long id;  
  
    private String nome;  
    private BigDecimal preco;  
  
    // getters e setters  
}  
  
@Repository  
public interface ProdutoRepository extends JpaRepository<Produto, Long> {  
  
    List<Produto> findByNome(String nome);  
}
```

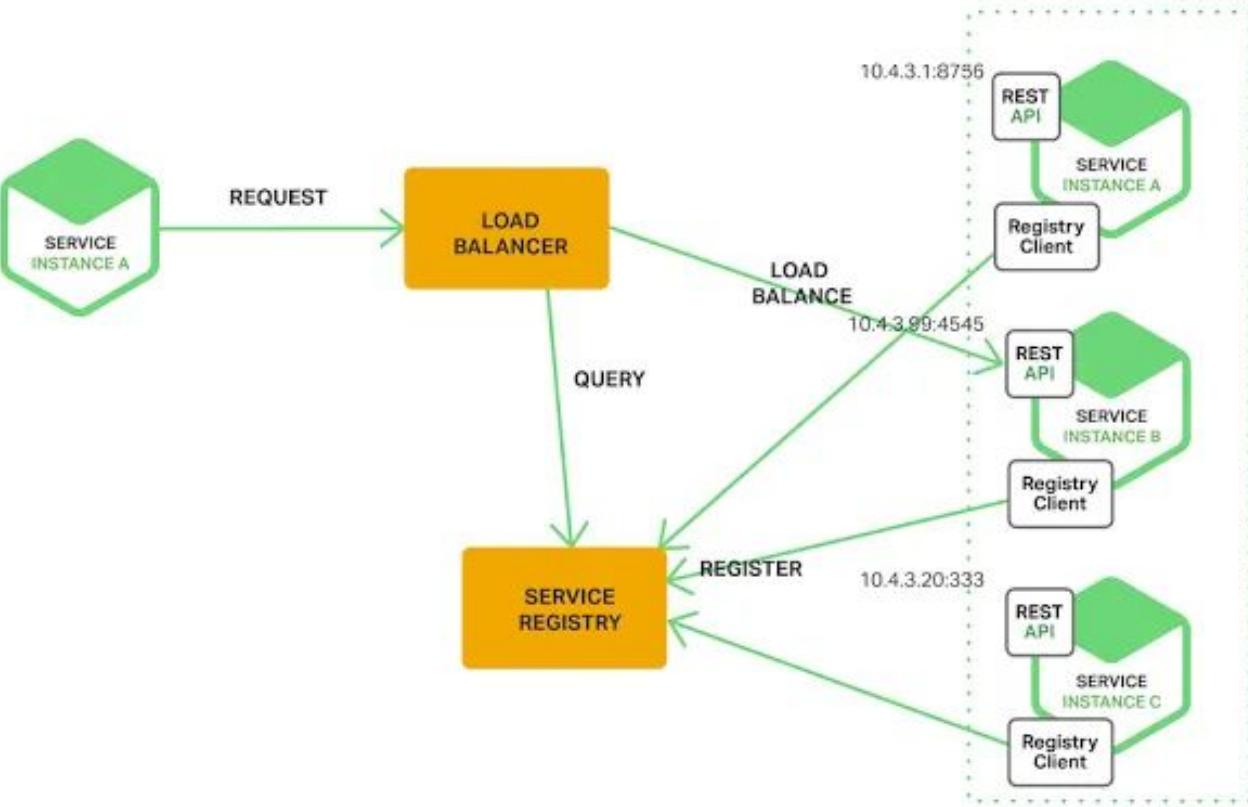

# Spring Security

```
@Configuration  
@EnableWebSecurity  
public class WebSecurityConfig {  
  
    @Bean  
    public SecurityFilterChain securityFilterChain(HttpSecurity http) throws Exception {  
        http  
            .authorizeHttpRequests((requests) -> requests  
                .requestMatchers("/", "/home").permitAll()  
                .anyRequest().authenticated()  
            )  
            .formLogin((form) -> form  
                .loginPage("/login")  
                .permitAll()  
            )  
            .logout((logout) -> logout.permitAll());  
  
        return http.build();  
    }  
  
    @Bean  
    public UserDetailsService userDetailsService() {  
        UserDetails user =  
            User.withDefaultPasswordEncoder()  
                .username("user")  
                .password("password")  
                .roles("USER")  
                .build();  
  
        return new InMemoryUserDetailsManager(user);  
    }  
}
```

```
...  
@Configuration  
@EnableWebSecurity  
public class SecurityConfig extends WebSecurityConfigurerAdapter {  
  
    @Override  
    protected void configure(HttpSecurity http) throws Exception {  
        http  
            .authorizeRequests()  
                .antMatchers("/api/recurso").authenticated()  
                .anyRequest().permitAll()  
            .and()  
            .formLogin()  
                .permitAll();  
    }  
}
```

## Arquiteturas e Padrões

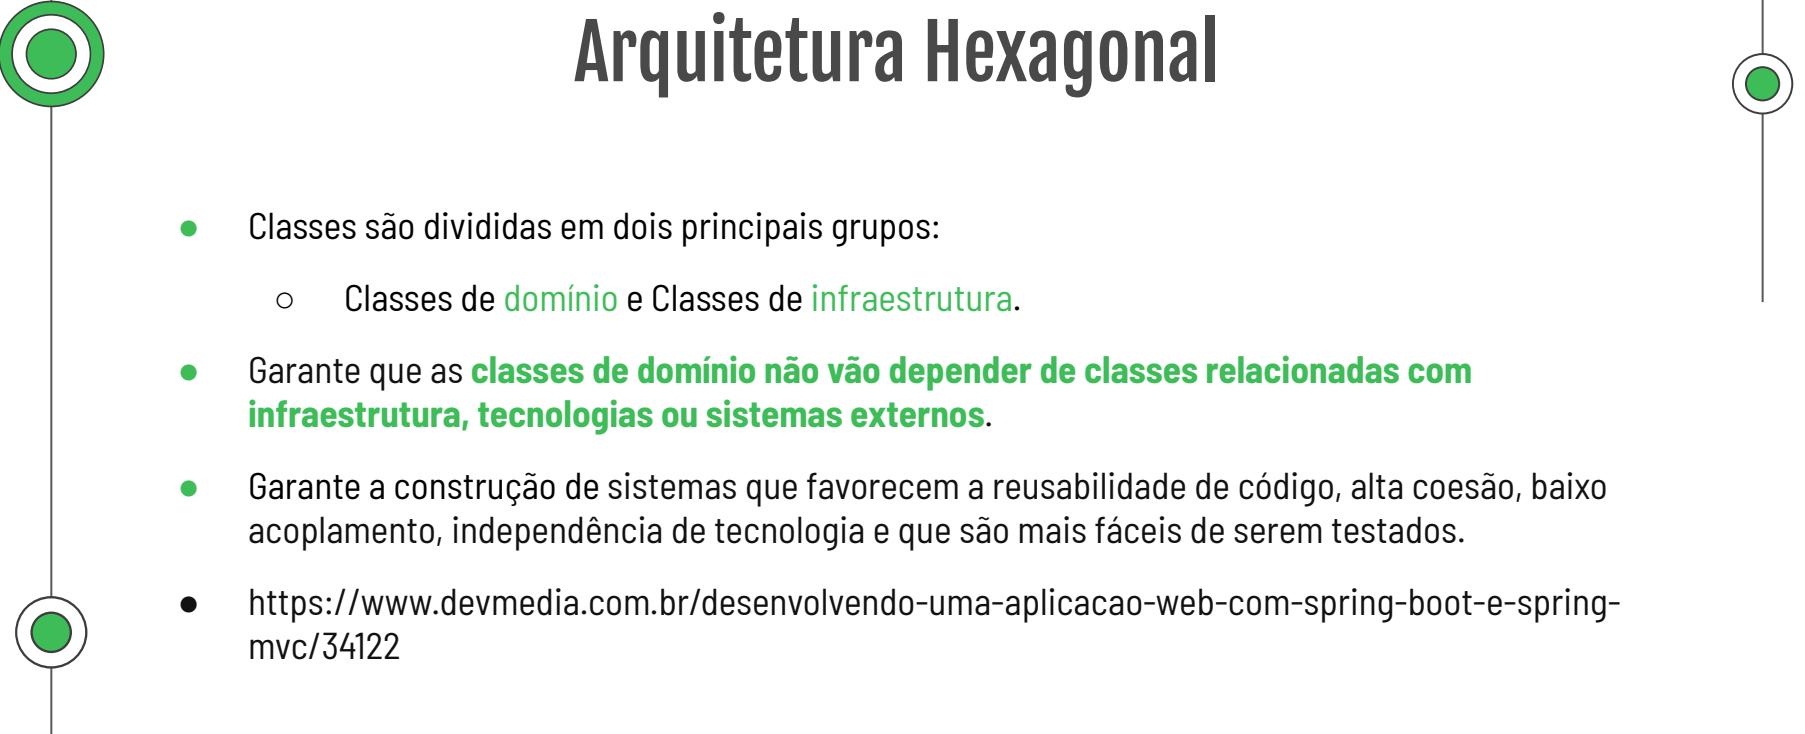

# Arquiteturas e Padrões

- SpringMVC
  - Artigo DevMedia sobre [SpringMVC](#).

# Arquitetura Hexagonal

# Arquitetura Hexagonal

- Classes são divididas em dois principais grupos:
  - Classes de domínio e Classes de infraestrutura.
- Garante que as **classes de domínio não vão depender de classes relacionadas com infraestrutura, tecnologias ou sistemas externos.**
- Garante a construção de sistemas que favorecem a reusabilidade de código, alta coesão, baixo acoplamento, independência de tecnologia e que são mais fáceis de serem testados.

# Casos de Uso

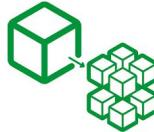

# Usos comuns e setores que se beneficiam do Spring

## Desenvolvimento Web

**Recursos abrangentes para criar aplicativos web escaláveis**

- \* Desenvolvimento de controladores
- \* Injeção de dependência
- \* Integração com frameworks de visualização

## Microservices

### Spring Cloud

- \* Facilita a criação, configuração e descoberta de serviços
- \* Fornece recursos para balanceamento de carga, tolerância a falhas e monitoramento de microservices

## APIs RESTful

- \* Suporte para mapeamento de endpoints

- \* Gestão de versões da API

- \* Serialização e desserialização de objetos JSON

- \* Autenticação e autorização

# Usos comuns e setores que se beneficiam do Spring

## Integração de sistemas

- \* Suporte para integração de serviços SOAP, RESTful e JMS
- \* Suporte a integração de bancos de dados, mensageria e sistemas de arquivos

## Aplicativos empresariais

- \* Oferece recursos para controle transacional
- \* Gerenciamento de cache
- \* Segurança
- \* Agendamento de tarefas
- \* Entre outros

## Setor financeiro

### Capacidade de lidar com requisitos complexos

- \* Transações seguras
- \* Integração com sistemas legado
- \* Conformidade regulatória

# Empresas que usam Spring

## Airbnb (Desenvolvimento Web)

Site para encontrar e reservar acomodações

## PayPal (API RESTful)

Troca de informações de forma segura entre dois sistemas de computador

## Netflix (Microservices)

Criação de um aplicativo com componentes independentes, habilitando a inovação

## Cisco (Integração de Sistemas)

União de sistemas e softwares de estoque, pagamentos, entre outros de maneira mais rápida e eficiente entre os setores

## Volkswagen (App Empresarial)

Controle transacional, gerenciamento de cache e integração de sistemas

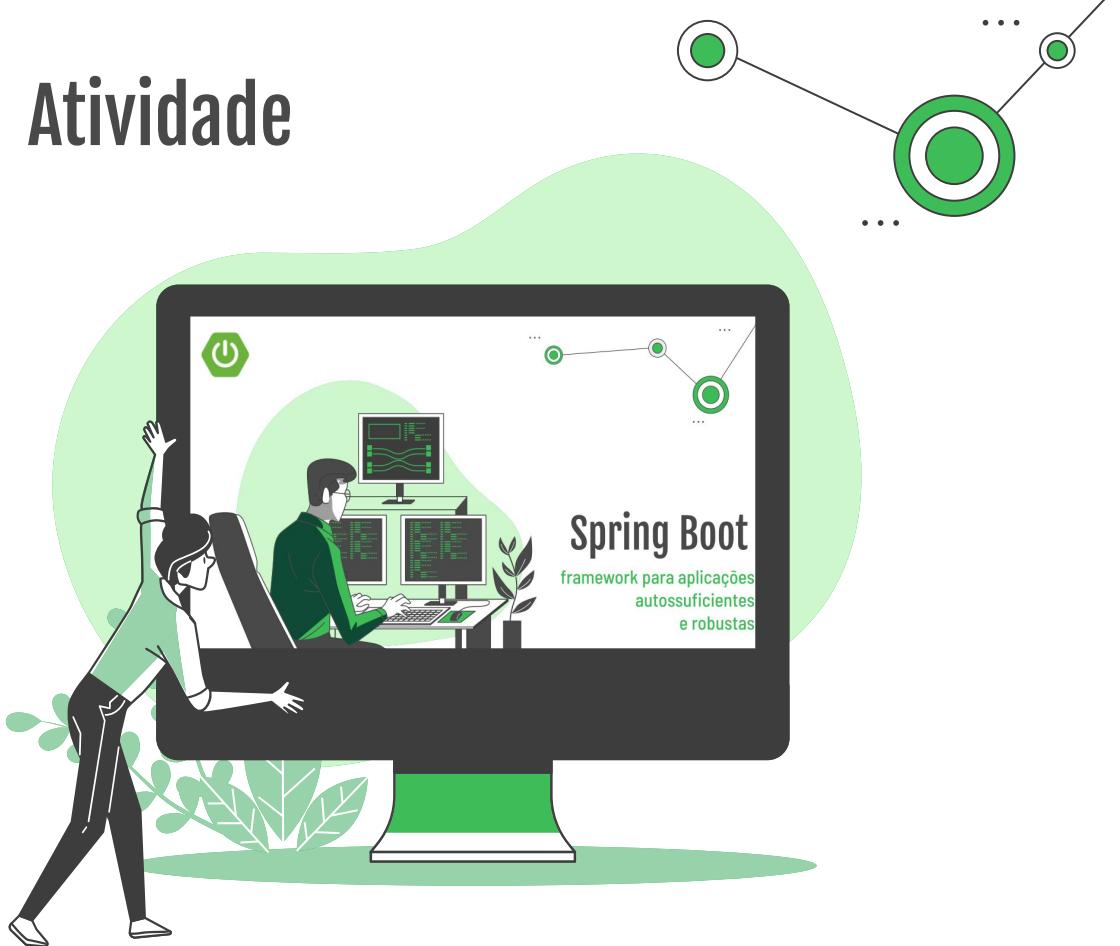

## Citibank (Setor financeiro)

Recursos de segurança avançada, controle transacional confiável e integração com sistemas de pagamento e serviços bancários
